

10. Full Grammar specification

This is the full Python grammar, derived directly from the grammar used to generate the CPython parser (see [Grammar/python.gram](#)). The version here omits details related to code generation and error recovery.

The notation is a mixture of [EBNF](#) and [PEG](#). In particular, & followed by a symbol, token or parenthesized group indicates a positive lookahead (i.e., is required to match but not consumed), while ! indicates a negative lookahead (i.e., is required *not* to match). We use the | separator to mean PEG's "ordered choice" (written as / in traditional PEG grammars). See [PEP 617](#) for more details on the grammar's syntax.

```
# PEG grammar for Python

# ===== START OF THE GRAMMAR =====

# General grammatical elements and rules:
#
# * Strings with double quotes (") denote SOFT KEYWORDS
# * Strings with single quotes (') denote KEYWORDS
# * Upper case names (NAME) denote tokens in the Grammar/Tokens file
# * Rule names starting with "invalid_" are used for specialized syntax errors
#   - These rules are NOT used in the first pass of the parser.
#   - Only if the first pass fails to parse, a second pass including the invalid
#     rules will be executed.
#   - If the parser fails in the second phase with a generic syntax error, the
#     location of the generic failure of the first pass will be used (this avoids
#     reporting incorrect locations due to the invalid rules).
#   - The order of the alternatives involving invalid rules matter
#     (like any rule in PEG).
#
# Grammar Syntax (see PEP 617 for more information):
#
# rule_name: expression
#   Optionally, a type can be included right after the rule name, which
#   specifies the return type of the C or Python function corresponding to the
#   rule:
# rule_name[return_type]: expression
#   If the return type is omitted, then a void * is returned in C and an Any in
#   Python.
# e1 e2
#   Match e1, then match e2.
# e1 | e2
#   Match e1 or e2.
#   The first alternative can also appear on the line after the rule name for
#   formatting purposes. In that case, a | must be used before the first
#   alternative, like so:
#       rule_name[return_type]:
#           | first_alt
#           | second_alt
# ( e )
#   Match e (allows also to use other operators in the group like '(e)*')
# [ e ] or e?
#   Optionally match e.
# e*
#   Match zero or more occurrences of e.
# e+
#   Match one or more occurrences of e.
# s.e+
#   Match one or more occurrences of e, separated by s. The generated parse tree
#   does not include the separator. This is otherwise identical to (e (s e)*).
# &e
```

```
# file type can be parsed, without consuming any input.
# ~
# Commit to the current alternative, even if it fails to parse.
#
